Rat DNA microarray capture oligonucleotide #30

```
This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then compared that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides chave a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region cc that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, cc metal, resin, gel, crystalline material and/or membrane, having semi-cc is particularly a layer of (bio) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, cp physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cardial to the method provides rapid, inexpensive and reproducible acids (amino, carboxylic or fatty acid) or their derivatives, salts and cardial based on comparison of nucleic acid gools, inceels, salts and capture nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADKO1381-ADKO1344 represent

CC reading out, where the nucleic acids are selectively bound using capture (c) reading out, where the nucleic acids are selectively bound using capture (c) comprise variable and non-variable regions. The capture oligonucleotides (c) have a 5'-invariable anchor region, the complement of which is present at (c) least once in each nucleic acid and a 3'-variable, discriminatory region (c) that comprises all possible combinations of by to 10 nucleotides to allow that comprises all possible combinations of the capture oligonucleotides are particularly locked nucleic acids (LNA) and the anchor region (c) capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, (c) metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface (c) is particularly a layer of (bio)molecular filaments and binding of single (c) stranded nucleic acids to the surface is (quasi) covalent, supramolecular, (c) hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food (c) additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or through a molecular sieve. (c) acids (amino, carboxylic or fatty acid) or their derivatives, salts and (c) acids (amino, carboxylic or fatty acid) or their derivatives, salts and (c) acids (amino, carboxylic or fatty acid) or their derivatives, salts and (c) acids is based on comparison of nucleic acid pool. Since the method is based on comparison of nucleic acid pool. Since the complete pattern of all nucleic acid pool. Since the complete uses in the nucleic acid pool. Since the complete uses in the nucleic acid pool. Since the complete acids in the method of the invention.

                                                                                                     Computies variable and non-variable regions. The capture oligonucleotides to have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow cC binding of particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25. T residues. The Capture oligonucleotides are biotinylated and immobilised on a surface by conducting properties and especially in the form of a chip. Its surface is particularly residues. The capture conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, cC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cardivity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic cardis (amino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible and callows imaging of the complete spattern of all nucleic acid in a cell, and companies on function of nucleic acid pools, since the method is based on comparison of nucleic acid pools, not individual constants in the method of the hourstion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example; Page 6; 8pp; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2003-714082/68

                                                             This invention describes a novel method for sorting single-stranded concleic acids by isolation and hybridisation of nucleic acid pools, then complete that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly 15-25, Tresidues. The capture CC agents are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, Tresidues. The capture crapture oligonucleotides are bickinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cativity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic cards (amino, carboxylic or fatty acid) or their derivatives, salts and concentratives. The method provides rapid, inxpensive and reproducible can detect very small differences in pools of nucleic acid from cells. It genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent trace persons used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 935
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADK01308;

CC nucleic acids by isolation and hybridisation of nucleic acids aby isolation and hybridisation of nucleic acid pools, then CC agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides CC least once in each nucleic acid and a 3 -variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture CC apture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio) molecular filaments and binding of single stranded nucleic acids. The surface is particularly a layer of (bio) molecular filaments and binding of single combinated by an electrical field or through a molecular, by stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in nucleic acids for the method provides rapid, inexpensive and reproducible and complements, especially minerals, trace elements, organic cardes (amino, carboxylic or fatty acid) or their derivatives, salts and cardinares. The method provides rapid, inexpensive and reproducible is allows imaging of the complete pattern of all nucleic acid single it the mothod is based on comparison of nucleic acid pools, not individual can be complete pattern of all nucleic acid pools. Since the cardinares matrix miniaturisation is possible. ADK01281-ADK01344 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SXS
CC have a 5'-invariable anchor region, the complement of which is present at CC that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorte of single stranded nucleic acids. The capture CC binding of particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single crystalline material and/or membrane, having semi-CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and compounds, e.g. food cacids (amino, carboxylic or fatty acid) or their derivatives, salts and compounds. The method provides rapid, inexpensive and reproducible constitution of differences in pools of nucleic acids from cells. It
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                              CC This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid pools, then CC reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture comprises are particularly locked nucleic acids (LNA) and the anchor region CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, certail, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly 1 alayer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, charity of sharmacation, nerve or germ cells and (ii) for determining the certails of particular the control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δ

Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Boekenkamp D,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 939
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Вþ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          អន្តិ អ
                    This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resid, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, a can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.
The invention relates to a method of enriching a low abundance polynucleotide in a sample of polynucleotides comprising a low abundance and a high abundance polynucleotide. The method comprises exposing the sample to an enzymatically non-extendable nucleobase oligomer having a nucleobase sequence complementary to a sequence within the high abundance polynucleotide under conditions so that base pairing occurs, and subjecting the sample to conditions for polymerase extension. Preferably, the enzymatically non-extendable nucleobase oligomer does not have a ribose-containing oligomeric structure. It is a peptide nucleoc acid (PNA) oligomer or is a modified nucleotide oligomer or internucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADM96310
                                                                                                                                                                                                                                            Enriching low abundance polynucleotides in a sample, useful for gene expression analysis, comprises exposing the sample to an enzymatically non-extendable nucleobase oligomer to block polymerase activity on high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13-NOV-2003

Coligomers. The modified nucleotide oligomer or internucleotide analogue coligomers is selected from locked nucleic acids (LNA), N3'-P5' Coligomer is selected from locked nucleic acids (LNA), N3'-P5' CC oligomers (MB-linked oligomers, minor groove binder-linked-coligomers, C1-C4 alkylphosphonate oligomers, phosphoramidates, beta-cc oligomers, C1-C4 alkylphosphonate oligomers, phosphoramidates, beta-cc oligomers, C1-C4 alkylphosphonate oligomers, phosphoramidates, beta-cc oligomers is chimeric. The care enzymatically non-extendable nucleobase oligomer is chimeric. The sample comprises more than one high abundance polynucleotide. The sample comprises more than one high abundance comprises transcription to yield a first strand cDNA. The method further comprises more than one high abundance comprises second strand cDNA synthesis. The sample is exposed to the nucleobase oligomer during the first and/or second strand cDNA synthesis. The sample is exposed to the comprises an amplification step, which is by creverse transcription (PCR) or by in vitro transcription. The RNA is cmand of cRNA or cotal cellular RNA. Alternatively, the sample comprises CC DNA, and polymerase extension is by DNA-dependent DNA polymerase in a comprises labelling the amplification. The cc methods are useful in selective enrichment of low abundance polynucleotides in a sample. The pool of enriched polynucleotides may be used in analysing gene expression and in creating cDNA libraries. The cc presents sequence represents a reverse transcriptiae (RT)-PCR primer which cannsporting, mitochondrial ATP synthase, subunit B, isoform 1 (ATP5F1) cc gene.

The modified nucleotide oligomer is selected from 2'-modified and 3'-modified nucleotide oligomers. The 2'-modified and 3'-modified nucleotide oligomers are selected from 2'-O-alkyl modified nucleotide oligomers and 3'-alkyl modified nucleotide oligomers. The 2'-O

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC comprising oligonucleotides, effective for alleviating controlled the sensitivity, levels of adenosine (A) or (A) receptors, construction, respiratory tract inflammation, allergies and concentration of hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating controlled the target polypeptide associated with lung airway or lung controlled the sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition composition composition of availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasconstriction, respiratory chairs, impeded respiration, respiratory condition, allergies, asthma, impeded respiration, respiratory condition, chronic obstructive pulmonary disease, pulmonary conditions to condition such as pulmonary disease, pulmonary conditions to condition the condition of the condition are associated conditions are associated conditions. The condition condition is condition to the condition are associated conditions are associated conditions. The condition is condition are associated conditions are associated conditions are associated conditions. The condition is condition are associated conditions are associated conditions are associated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, t prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nyce JW,

The invention is useful for analy expression in a sample and creating cDNA libraries. The present is reverse transcriptase (RT) primer used in the synthesis of a artificial gene transcript.
                                                          Chen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enriching low abundance polynucleotide relative to a high abundance polynucleotide in a sample, for analyzing gene expression and creating cDNA libraries, comprises blocking polymerase activity on high abundance

CC Also disclosed is a method for amplifying a population of RNA molecules CC to produce a pool of double-stranded cDNA molecules, and a kit for CC synthesising quantitative information about the genetic profile of nucleic acid in original RNA sample. The method of the invention is CC useful in differential gene expression assays for the analysis of CC useful in differential gene expression assays for the analysis of CC diseased and normal tissue and for large-scale correlation studies on CC sequences, mutations, variants or polymorphisms among samples. The method CC is efficient in synthesising improved cDNA molecules and effective in CC generating useful quantities of an amplified cRNA product that comprises CC a population of cRNA molecules in substantially the same relative molar cratio as the RNA or mRNA starting material. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for synthesising double-
stranded cDNA, by synthesising first cDNA strands in a first reaction
mixture comprising reverse transcriptase, RNA template, and first strand
                      Example 5; Page 103; 286pp; English
                                                       Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                         25-NOV-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene three current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromogranin B (CHGB;secretogranin 1;SCG1) DNA which is located at chromosomal position 20pter-p12.
                                                                                                                      The invention relates to a novel human nucleotide reducing enzyme 59.62 polypeptide and encoding polypucleotide. The polypucleotide, polypeptide and its antagonist are useful for treating e.g. embryo development teratogenesis, blood system disease, and growth development disturbance disease. The present sequence represents the human nucleotide reducing enzyme 59.62 cDNA isolating RT-PCR primer
                                                                                                                                                                                                                                                                     Human nucleotide reducing enzyme 59.62 polypeptide and its encoding polynucleotide, for treating e.g. embryo development teratogenesis.
                                                                                             Sequence 24
                                                                                                                                                                                                                                                                                                                         WPI; 2002-305607/35

The method comprises adding to a test sample a 1st primer, that serves as telomerase and nucleoside triphosphate (dNPP) and incubating to allow primer extension by the telomerase, amplifying the extension product, immobilising the amplification product (AP) on a solid phase and qualitative and/or quantitative detection of AP, where the substrate primer is preferably from the 5'-region of the long terminal repeat 2 (LTR-2) sequence of a retrovirus. The method can be used to diagnose tumours and screen compounds for effector activity. Immobilisation of AP provides a signal that is reproducibly representative of telomerase activity, eliminates the need for gel electrophoretic separation and provides high sensitivity. Radioactive labels are not required and the method can be automated for routine use. Specific detection is achieved by proper choice of hybridiastion conditions, without separation of the telomerase extension product. A specific signal is generated by 1-10 cell equivalents, but for tumour analysis 10-1000 ng of tissue is usually used

                                                                                                                                                                                                                                                      The invention relates to isolated RNAs comprising an intron RNA that is released in a cell, thus modulating the function of a target gene. Also disclosed is a DNA template for the isolated RNA, an expression vector comprising the DNA, and a composition comprising one or more agents that induce RNA-mediated modulation of the functions of two or more target genes in a cell, such as a mammalian cell. The isolated RNAs and compositions are useful for modulating the function of a target gene in a cell, e.g. to inhibit a cancer-related gene, potential viral gene, and microbe-related gene, and thus useful for treating and preventing diseases such as cancer and viral/microbial infections. The current sequence represents a potential poly-pyrimidine tract of the artificial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated RNAs comprising an intron RNA that is released in a cell, thus modulating the function of a target gene, useful for treating and preventing diseases such as cancer and viral/microbial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; antimicrobial; virucide; gene therapy; RNA intron; cancer; viral; microbial; infection; poly-pyrimidine tract; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                      Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate (a) double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAO75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

This invention describes a novel method for sorting single-stranded conductive acids by isolation and hybridisation of nucleic acid pools, then comprise variable then nucleic acids are selectively bound using capture comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at certain once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow comprises are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids. The conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, computed by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, having semical sused (i) for analysis of patterns, especially in mucosal, cards (amino, carboxylic or fatty acid) or their derivatives, salts and cards (amino, carboxylic or fatty acid) or their derivatives, salts and cards (amino, carboxylic or fatty acid) or their derivatives, salts and can detect very small differences in pools of nucleic acid from cells. It can detect very small differences in the mucleic acid from cells. It capture probes used in the method of the invention.
                                                                                                                                                                                                                                          RESULT 953
                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                         S

                                                                                                                                                                                                                                            ৪
                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid pools, then CC reading out, where the nucleic acids are selectively bound using capture CC agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides CC have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow CC binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is quasil covalent, supramolecular, chair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and compounds imaging of the complete pattern of all nucleic acid from cells. It can detect very small differences in the mucleic acid good. Since the method is based on comparison of nucleic acid pools, not individual capture probes used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                 Synthetic
                                                                                                                                                                                                                                                                                                                               Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AQ075547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes.                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ755978) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAQ75753 standard; DNA; 21 BP.

         A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files ANQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes.                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 1 A; 1 C; 1

The method can be used to analyse gene expression rapidly and easily

                        The present invention describes a method for the comparative detection of the amount of an RNA. The method comprises; (a) cDNAs obtained by compared by using a same restriction enzyme; (b) each different adaptor and a common adaptor are added to each of the cDNA fragments derived from the same or different tissues by the step (a); (c) the resultant adaptor added cDNAs are mixed together; (d) an adaptor primer having the common sequence to said different adaptor and a gene-specific adaptor are used to amplify said adaptor-added cDNAs containing no region derived from compositive acid of the mRNA before the addition of the adaptor among the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the CDNA amounts are measured between the tissues; (f) the RNA is detected from the measured result; (g) each different adaptor and a common adaptor comitive transfers; (i) the adaptor-added genomic DNAs are amplified by using an adaptor primer having the common sequence to the different adaptor and a sequence-specific adaptor; and (j) the ratios of the amplified by using of the genomic DNAs are measured between the tissues; the ratios of the amplified mounts of the genomic DNAs are amplified by using the common sequence to the different adaptor and a sequence-specific adaptor; and (j) the ratios of the amplified mounts of the genomic DNAs are measured between the individuals. The method is used for the detection of the amounts of RNA and DNA. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś

CC of gene expression in one or more samples, comprising an identifier having a specific oligo-dT primer sequence, where the identifier comprises a CC detectable marker at its 5' end. The system is useful for identifying any detectable marker at its 5' end. The system is useful for identifying any CC or all genes expressed in a given in vivo or in vitro RNA sample, as well can sthe relative differences in mRNA between 2 or more samples, where CC desired, for supporting discovery of new genes, and for identifying mRNAs that are expressed in a different levels between 2 or more samples. The new CC system or method addresses limitations of prior methods by comprising CC compositions and systems that incorporate new strategies where molecular or biochemical assay compositions and systems are linked to DNA or RNA cc sequence databases for optimal resource efficiency in assaying gene CC expression. The system has the following advantages over existing CC methods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence information in addition to information concerning changes or differences in mRNA level, to determine mRNA expression level and mRNA identification in one assay; (c) generates cDNA fragments from all mRNAs present in the cc sample for subsequent investigation by common molecular biology compositions lacking significant genomic sequence in formation. The present consequence represents an oligo dT primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying and characterizing gene expression in samples, identifying mRNAs expressed at different levels, comprises identimer having a oligo-dT primer of a specific sequence a detectable marker at its 5' end.

The system is useful for identifier having a given in vivo or in vitro RNA sample, as well cas the relative differences in mRNA between 2 or more samples, where CC desired, for supporting discovery of new genes, and for identifying mRNAs that are expressed at different levels between 2 or more samples. The new compositions and systems that incorporate new strategies where more system or method addresses limitations of prior methods by comprising CC compositions and systems that incorporate new strategies where molecular or biochemical assay compositions and systems are linked to DNA or RNA compositions and systems and systems are linked to DNA or RNA compression. The system has the following advantages over existing compression. The system has the following advantages over existing composition in addition to information concerning changes or differences in formation in addition to information concerning changes or differences continued to the sequence sample for subsequent investigation by common molecular biology compositions and (d) does not require prior knowledge of the sequence of the organism under investigation and can be employed in concernion and can be employed in sequence represents an oligo of primer used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel human zinc finger-containing CC proteins and their coding sequences; MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome (fight). The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, CC or in manufacturing a medicament for treating or preventing a disorder CC associated with decreased or increased expression or activity of MDZ3, CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic CC acids and proteins are also useful for diagnosing or monitoring a disease CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic CC acids can also be used as probes to detect and characterize gross CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are CC useful in constructing microarrays for measuring gene expression. The CC proteins are useful as therapeutic agents for gene therapy or as CC vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The inventors claim a gene fragment comprising (a) the enhancer DNA segment and (b) a structural gene such as human D, V and J gene, and promoter. Using the gene fragments of the invention, transcription etranslation efficiency are enhanced. (Updated on 25-MAR-2003 to corr

The present invention describes enzymatic nucleic acid molecules with RN cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17560 and AAA17633 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA18386 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA1908 and AAA19155 to AAA19222 represent their corresponding target sequences;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes nucleic acid molecules which modulate t synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VGGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase i (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antifilammatory; antiarthritic; antisoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-OCT-1999.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 17 BP; 1 A; 3 C; 0 G; 0 T; 13 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21696 to AAA21688 represent their corresponding target sequences; AAA21696 to AAA22165 and AAA2363 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA23476 to AAA23262, AAA23343 to AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT; integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, and other syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 CC AAA19125 to AAA19222 represent their corresponding target sequences; CC AAA19265 to AAA21501 to AAA21501 to AAA21502 to AAA21500 and CAA21595 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA221688 represent their corresponding target sequences; CC AAA21595 to AAA22475 and AAA23263 to AAA23343 to CC aAA23422 represent their corresponding target sequences. The ribozymes of CC the invention are used for modulating the synthesis, expression and/or CC their invention are used for modulating the synthesis, expression and/or CC their subunit beta-3, integrin subunit alpha-6, or Tie-2. They are cespecially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARWD), inflammation, and arthritis, as well as CC especialry glaucoma, myopic degeneration, psoriasis, verruca vulgaris, CC andiother syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit alpha-6, or integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC apable of modulating a process in a biological system. The method cc capable of modulating a process in a biological system. The method cc comprises: (a) introducing into the system a random library of nucleic cc acid catalysts (NAC) having a substrate binding domain (SBD), comprising catalysts (NAC) having a substrate binding domain (SBD), comprising catalysts are modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with cc endonuclease activity and catalytic activity, from the present invention, cc are used to modulate gene expression in plant and mammalian cells and to cc leave target nucleic acid, particularly for treating systemic diseases caused by specific and, e.g. cancer, inflammation, psoriasis, non-hepatic cacides and infection. They may also be used to detect genetic drift and cc ascites and infection. They may also be used to detect genetic drift and cc used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or cc used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or cc generally any condition associated with the level of c-raf. Introduction cf of sugar/phosphate modifications increases stability against nuclease and cc method, specifically for modulating the expression of a Raf gene excent cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC probes which comprise various different enhancer elements. These were CC used as competitor probes in competition gel mobility shift assays CC performed to determine the specificity of drug-inducible nuclear proteins CC for a fragment of the 5' flanking region of the human apolipoprotein AI (apo AI) gene comprising the sequence between bases -79 and -44 from the CC transcriptional start site (AAZ38357). This apo AI fragment contains two CC DRES (AAZ38355) and popposite orientations, and was used in the CC construction of plasmids pGL2 (apoAI-DRE)TK/luc (AAZ38352), which CC contains one copy of this fragment, and pGL2 (4xapoAI-DRE)TK/luc (AAZ38353) which contains four copies. The fragment (s) were inserted CC upstream of the HSV thymidine kinase (TK) promoter and luciferase CC reporter gene in the pGL2 TK/luc vector The pGL2 TK/luc vector also CC comprises a functional polyadenylation sequence downstream of the CC reporter gene. Plasmids pGL2 (apoAI-DRE)TK/luc and pGL2 (4xapoAI-DRE)TK/luc are used in a novel method for screening for a drug that CC increases expression of a gene for apolipoprotein (apo AI), which is CC associated with coronary artery disease. Such plasmids may be transformed CC untreated cells. The method is useful for screening and identifying drugs that increase apo AI gene expression, the identified drugs would be cuseful for treating coronary artery disease. The method is simple, rapid, candular contains coronary artery disease. The method is simple, rapid, candular contains form and coronary artery disease. The method is simple, rapid, candular contains coronary artery disease. The method is simple, rapid, candular coronary artery disease. The method is simple, rapid, candular coronary artery disease. The method is simple, rapid, candular coronary artery disease. The method is simple, rapid, candular coronary artery disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC with a target sequence and contain at least one phosphoro (di) thicate (CC link, having endonuclease activity. (A), and more generally any catalytic (CC nucleic acid (A') that modulates expression of the oestrogen receptor (CC gene, are used to treat cancer (particularly of breast or endometrium), (CC in vivo or by transforming cells ex vivo and implanting treated cells, or (CC for other conditions associated with levels of oestrogen receptor. (CC Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, (CC particularly for identification of therapeutic targets, and as research (CC reagents (for RNA, in the same way that restriction endonucleases are (CC used with DNA). The combination of modifications in (A) improves (CC QAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA25192 represent their corresponding target sequences, and CC QAA24748 to AAA25192 represent their corresponding target sequences, and AAA25107 to AAA26218 represent their corresponding target sequences and CC anacences, and AAA26107 to AAA26218 represent obstrogen receptor hairpin ribozyme sequences and CC anacences, and AAA26107 to AAA26218 represent obstrogen receptor hairpin traget sequences and continense oligonucleotides used in the exemplification of the present corresponding target sequences and continense oligonucleotides used in the exemplification of the present

                                                                                                                                                                                                                                                                                 The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of pressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor production alpha and erythropoletin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2000-647423/62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 17 BP; 0 A; 1 C; 4 G; 0 T; 12 U;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 factor gene, IRF-2 and/or the CAATT Displacement Frotein (LDF). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production erythropoietin, granulocyte colony stimulating factor protein and

                                                                          CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 CC lcan be used in gene therapy and vaccine production. The hGDMLP-1 cc nucleic acids in samples, as amplification substrates and quantify cc hGDMLP-1 nucleic acids in samples, as amplification substrates, to c provide initial substrates for the recombinant engineering of hGDMLP-1 cc protein variants having desired phenotypic improvements, and for c expressing the proteins. The hGDMLP-1 proteins or polypeptides may be cused as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration cand/or amount specifically of hGDMLP-1 proteins, as specific blomolecule capture probes for surface-enhanced laser description ionisation, as construction, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The colorated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the expression of the present invention. N.B. chapter as content on the present invention. N.B. the sequence data for this patent did not form part of the printed capture in the many obtained in electronic format directly from MIPO care from wino intronic handled in electronic format directly from MIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-JAN-2001;

                  The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LT 979

                                                                                                                                                                                                                                                                                                                                                                                                               v polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
as specific biomolecule capture probes for surface-enhanced laser
sorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ۲

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; genome-derived myosin-like protein 1; GDMLP-1; muscle; myosin; chromosome 22; gene therapy; vaccine; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                         New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
```

The present invention protein 1 (hGDMLP-1).

invention describes a human genome-derived myosin-like MGDMLP-1). The protein and polynucleotide sequences of

hGDMLP-
